Cricket Player Performance Analyzer

Power BI Dashboard Plan — 10 Business Questions

Purpose: Organize the three report pages in the provided Power BI report and define business questions and suitable visuals for the ODI cricket ball-by-ball dataset.

Dashboard 1 — Team & Match Analysis

No.	Business question	Suggested visual
1	What are the total recorded runs, total matches, and total deliveries in the dataset?	KPI Cards
2	Which batting teams have recorded the highest total runs?	Clustered Bar Chart
3	How do total runs vary by venue?	Clustered Column Chart
4	How does match activity change by date?	Line Chart; use start_date as the date field

Filters shown in the report: match date, batting team, and venue. Use these slicers to focus the team and match visuals on a selected date range, team, or ground.

Dashboard 2 — Batting Performance Analysis

No.	Business question	Suggested visual
5	Which batters have scored the most runs?	KPI Card + Clustered Bar Chart
6	Which batters have the highest batting strike rate?	Clustered Bar Chart
7	How do fours and sixes compare across batters?	Clustered Column Chart
8	How do a selected batter’s runs, balls faced, strike rate, and boundaries compare?	Table / Player Detail Table

Filters shown in the report: striker, batting team, and match date. The report also contains cards for Batter Runs, Balls Faced, Batting Strike Rate, and Total Fours.

Interpretation note: Strike rate should be interpreted alongside balls faced and runs; a high strike rate from a very small number of balls may not represent sustained performance.

Dashboard 3 — Bowling Performance Analysis

No.	Business question	Suggested visual
9	Which bowlers have taken the most wickets?	KPI Card + Clustered Bar Chart
10	How does bowling economy compare across bowlers, and what dismissal patterns appear in the data?	Clustered Bar Chart + Donut Chart

Additional report elements: cards for Bowler Wickets, Bowler Runs Conceded, and Bowling Economy; a bowling summary table by bowling team and bowler; and a dismissal-count donut visual.

Filters shown in the report: bowler, bowling team, and match date.

Suggested Common Filters

Match date (start_date), batting team, bowling team, venue, striker, and bowler. Keep slicers relevant to each page and synchronize date/team filters across pages when it improves comparisons.

Metric Notes & Data Interpretation

• Use the fields and measures already present in the provided PBIX, including total_runs, Total Matches, Total Deliveries, Batter Runs, Balls Faced, Batting Strike Rate, Total Fours, Total Sixes, Bowler Wickets, Bowler Runs Conceded, Valid Balls Bowled, and Bowling Economy.

• Use the report's actual Power BI results to describe findings. This plan does not assume which team, batter, bowler, or venue performs best.

• Confirm the definition of each DAX measure against the dataset grain. Ball-by-ball rows should not be counted as matches; match totals should use a distinct match identifier if available.

• Dismissal visuals depend on valid player_dismissed records. Do not treat every delivery as a dismissal.

• The provided report is titled with an ODI cricket cleaned dataset model; this plan is tailored to the fields visible in the uploaded PBIX rather than assuming IPL-specific fields.
